

BACKUP & DISASTER RECOVERY

ACE Technology Group

Over **90%** of companies **fail within two years** of being struck by a disaster.

40% of businesses **do not reopen** following a disaster.

24% of organizations chose **COST SAVINGS** as the one primary reason to use cloud backup.

WHY IS THIS IMPORTANT?

Backup & Disaster Recovery (BDR) is key to ensure that businesses can quickly recover from minor and major incidents, such as accidentally deleting a file or catastrophic events, such as a flood/fire or a ransomware attack. It's imperative to businesses today to have a functioning and dependable BDR plan in place to be able to recover company data quickly and thoroughly.

Having a reliable backup and recovery system can mean the difference between losing a few hours of work and losing a few weeks or months of work. With most companies relying on data to function, not having it for any period of time can halt business and lead to expensive and unanticipated down-time.
