VISIBILITY & CONTROL

Ensure consistent security settings and gain real-time visibility into wireless usage.

WHY IS THIS IMPORTANT?

Having a managed wireless network will allow for important security updates to be rolled out during off-times that can prevent unauthorized access to a company's network and information.

Another benefit is the capability of having wireless run on a schedule to ensure access is only enabled during a set time, typically during office hours. During this time, it will allow devices to connect to the wireless access point, and it will stop broadcasting when the set time is over. On a none technical level, managed wireless allows companies to focus on their business and not worry about who is connecting to their network.
